NAME

submit - run a backround process

SYNOPSIS

submit [-p priority] command [arguments]

DESCRIPTION

Submit is based on the TSO submit command. It is used
an execute an independent backround process. It is par-
ticularly useful if you wish to execute a long running
process without tying up a terminal. Process output
(including error output) is directed to a file named
"subs###.out".   A file named submit.log is created to
record start and finish times for submitted processes.
Finally, if the user is signed-on when a submitted pro-
cess completes (s)he receives a message on the termi-
nal.

The user may specify a priority for a submitted process
by including a -p flag followed by a number from 0 to
20. Minimum priority is 20 and maximum is 0.   For
further information see the "nice" command.
